

Update to ESTAR, PSTAR, and ASTAR Databases

A result of Report 90 (ICRU, 2014) of the International Commission on Radiation Units and Measurements (ICRU)^a has been to update stopping powers and ranges of electrons, positrons, protons, and alpha particles in three materials: air (dry, at sea level), graphite, and liquid water. This addendum to the ESTAR, PSTAR, and ASTAR databases provides these updated results, but only in a non-interactive set of computer-readable tables. The ICRU Report considered also stopping powers and ranges of carbon ions in these three materials, and these results are included also.

^a This Report was released in 2016; the members of the Report Committee were S. M. Seltzer (Co-Chairman), J. M. Fernández-Varea (Co-Chairman), P. Andreo, P. M. Bergstrom Jr., D. T. Burns, I. Krajcar Bronić, C. K. Ross, and F. Salvat.

The methods underlying the calculations, as detailed in ICRU Report 90, are basically the same as those used earlier, but with differences listed below.

- The key parameter in Bethe's theory of charged-particle electronic (collision) stopping power, *i.e.*, the mean excitation energy, I , was thoroughly reviewed, with the results: $I = 85.7$ eV for air (no change from previous recommendation), $I = 81$ eV for graphite (previous recommendation was 78 eV), and $I = 78$ eV for liquid water (previous recommendation was 75 eV).
- The density-effect correction, δ , for the electronic (collision) stopping powers in graphite assumes a mass density of $\rho = 2.25$ g cm⁻³ rather than $\rho = 1.7$ g cm⁻³, and assumes there is one conduction electron rather than two.
- The radiative stopping powers, S_{rad} , for electrons and positrons are now taken from Seltzer and Berger (1986), which are slightly different from the somewhat more preliminary results of Seltzer and Berger (1985).
- The low-energy electronic (collision) stopping powers for protons in graphite are taken from the measured results of Nečas *et al.* (1993) rather than those used in ICRU Report 49 (ICRU, 1993).

The tables use the following symbols:

T , kinetic energy of the charged particle

S_{el} , electronic (collision) stopping power

S_{rad} , radiative stopping power (given here for electrons and positrons)

S_{nuc} , nuclear stopping power (given here for protons, alpha particles, and carbon ions)

S_{tot} , total stopping power

r_0 , csda range of the charged particle

Y , radiation yield (given here for electrons and positrons)

δ , density-effect correction
